ABSTRACT / 摘要
The thesis's reasoning suggests that Roosevelt would take advantage of the administrative intervention inertia of the New Deal to gradually nationalize key industries (such as banking, railways, and energy), and establish a mixed economy with public ownership as the main body. This is not a Soviet-style comprehensive planned economy, but rather "socialism with American characteristics" that retains some market mechanisms. Roosevelt's "New Deal Coalition" would evolve into a single ruling party or a de facto "vanguard". The two-party system in the United States will be broken, and the democratic system will transform into a "people's democratic dictatorship" or a "democratic centralism" to ensure the smooth progress of socialist transformation. Through large-scale wealth redistribution and welfare systems, the United States will eliminate extreme poverty, but it will also lead to the intensification of class conflicts. The thesis may deduce the fierce resistance between capitalists and conservative forces, and even trigger civil wars or large-scale social unrest.
The paper emphasizes that the period of the New Deal of Roosevelt was the "historical window" that brought the United States closest to socialism. If Roosevelt himself had a stronger left-wing ideology or if the social contradictions at that time had further intensified, it was entirely possible that the United States would have taken a path different from capitalism. The research conclusion usually holds that the United States is not inherently immune to socialism. The so-called "American exceptionalism" is merely a product of specific historical conditions, rather than an unchangeable destiny. The paper will ultimately point out that this thought experiment reveals the fragility of the capitalist system and the historical rationality of socialism as an alternative. It reminds us that the direction of historical development is not linear but full of various possibilities

IMPACT STATEMENT / 影响声明

I. INTRODUCTION / 引言

Introduction

1. Research Background and Motivation

This paper explores the speculative yet significant historical counterfactual: the potential transformation of the United States into a socialist republic after 1945,

under a more ideologically committed left-wing presidency of Franklin D. Roosevelt. Recent years have witnessed a renewed global interest in critiques of capitalism and alternative socio-economic models, driven by rising inequality and systemic crises. This scholarly context invites a rigorous re-examination of pivotal historical moments where the trajectory of major powers might have diverged. A systematic investigation into this "road not taken" by the United States is motivated by its potential to deepen our understanding of the contingency of historical development, the structural vulnerabilities of capitalist democracies in the mid-20th century, and the ideological boundaries of American political possibility.

2. Related Work

Existing scholarship primarily falls into three categories. First, substantial historical research details the extent and limits of Roosevelt's New Deal, debating whether it constituted "creeping socialism" or a rescue of capitalism. Second, political theory works analyze the conceptual and practical challenges of implementing socialism within a liberal democratic framework, often citing the American case as exemplifying inherent incompatibility. Third, a growing body of counterfactual historical studies examines alternative outcomes for major 20th-century events. However, a focused, systematic analysis that merges a detailed historical premise (a leftward shift in Roosevelt's post-1945 agenda) with a political-economic projection of a fully realized American socialist state remains a gap in the literature.

3. Main Contributions

This paper aims to make the following contributions:

Theoretical Framework: It develops a structured model for transitioning a developed capitalist democracy into a socialist republic, focusing on phased economic nationalization, political realignment, and social restructuring.

Historical Analysis: It provides a detailed examination of the post-war political-economic landscape in the U.S., identifying specific pressure points and policy levers that a determined socialist administration could have utilized.

Scenario Projection: It constructs a plausible alternate timeline, projecting the potential domestic and international consequences of such a transformation, including likely internal resistance and shifts in the Cold War dynamic.

4. Paper Organization

The remainder of this paper is structured as follows. Section 2 outlines the methodological approach of counterfactual history and defines key terms. Section 3 establishes the historical precondition: an analysis of Roosevelt's New Deal coalition and post-war planning, arguing for its latent socialist potential. Section 4 details the proposed transition model, encompassing economic, political, and social dimensions. Section 5 explores the projected outcomes and major challenges of this new "Socialist Republic of the United States of America." Finally, Section 6 concludes by discussing the implications of this counterfactual for understanding historical contingency and

contemporary political economic thought.

II. Results / 结果

4. Experimental Results

This section presents the experimental results evaluating the proposed model for a socialist transition in the post-1945 United States. The analysis employs both quantitative projections and qualitative historical comparisons.

4.1 Quantitative Analysis (Table I)

Table I compares the projected key socio-economic indicators of the hypothesized Socialist Republic of the United States of America (SRUSA) by 1960 against the actual historical data of the USA and the contemporary Soviet Union.

Table I: Projected Key Indicators Comparison (c. 1960)

Indicator Historical USA (Capitalist) Projected SRUSA (Model) USSR (Historical) Notes
GINI Coefficient ~0.38 (1960) ~0.25 ~0.26 (1960 est.) Measures income inequality. A lower score indicates greater equality.
Public Ownership of Industry ~10-15% ~60-70% ~100% Percentage of major industrial assets (steel, energy, rail) under state control.
Voter Turnout / Party Membership ~60% (Presidential) ~95% (Single Party Congress) ~99% (Soviet Elections) Measures formal political participation within the new structure.
Unemployment Rate ~5.5% (1960) ~1-2% (Projected) Officially 0% Projection based on state-guaranteed employment.
Military Spending as % of GDP ~9% (1960) ~12-15% (Projected) ~12-15% (1960 est.) Projected increase due to intensified Cold War posture and need for internal security.

* Key Findings: The model projects that the SRUSA would achieve a significant reduction in income inequality (GINI improvement of ~34%) and virtual elimination of unemployment, primarily through wealth redistribution and state-directed employment. This comes at the projected cost of a massive expansion of the state sector (increase of ~400% in public ownership) and a likely increase in military/security expenditure due to anticipated internal and external tensions.

4.2 Qualitative Results (Figure 1)

Figure 1 illustrates the proposed phased transition mechanism and its projected societal outcomes.

Figure 1: Phased Transition Model & Projected Outcomes

Phase 1: Seizure of Leverage (1945-1948)
Phase 2: Consolidation & Planning (1948-1955)
Phase 3: Institutionalization (1955-)
[Nationalize Fed, Key Industries]
[Collectivize Agriculture, 5-Year Plans] [New Constitution, Socialist Culture]
| | |
V V V
[Capital Flight, Initial Strikes]
[Rationing, Black Markets, Internal Security Apparatus] [Stable but Stagnant Command Economy]
| | |
V V V
Domestic: Political Realignment
Domestic: Class Conflict / Suppression
Domestic: "New Soviet Man" Ideology
International: Allied Rift
International: Cold War as Ideological Crusade
International: Leader of "Socialist Bloc"

* Key Interpretation: The qualitative analysis shows that the transition, while achieving its core economic equality goals, would instigate a sequence of profound disruptions. The initial economic interventions (Phase 1) would trigger capital flight and social resistance. The consolidation phase (Phase 2) would be characterized by severe economic shortages and the rise of a powerful security state to manage dissent. The final phase (Phase 3) projects a stabilized but less innovative and consumer-oriented society, locked in an even more ideologically charged Cold War confrontation.

4.3 Comparative Performance

The proposed transition model is evaluated against two baseline "methods":

* Baseline 1 (Historical Path): The actual capitalist, liberal democratic development of the post-war USA.
* Baseline 2 (Soviet Model): A rapid, revolutionary imposition of socialism as seen in the USSR post-1917.

Results: The proposed "American Socialist Transition" model demonstrates a divergent optimization profile. Compared to Baseline 1 (Historical USA), it shows superior performance on equality and welfare metrics (projected improvement of 30-40%) but severely underperforms on metrics of political liberty, economic innovation, and consumer abundance. Compared to Baseline 2 (Soviet Model), it projects a potentially more stable and less violent transition (due to leveraging existing New Deal institutions), but would likely converge towards a similar endpoint of a one-party state with a planned economy, albeit with a potentially higher standard of living. The experiment indicates that the primary trade-off is between radical equality and systemic political-economic pluralism.

III.Discussion / 讨论

5. Discussion and Analysis

The experimental results present a coherent but highly contingent projection of an alternative United States. This section discusses the key findings, their implications, and the fundamental tensions inherent in the proposed socialist transition model.

5.1 Analysis of Projected Outcomes and Trade-offs

The core finding is a definitive trade-off between equality and other socio-economic goods. The model successfully projects the achievement of the primary socialist objective: a drastic reduction in economic inequality, as quantified by the Gini coefficient reduction governed by a redistribution function:

$$G_{t} = G_{t-1} \cdot e^{-k \cdot R_t}$$

where G_{t} is the Gini coefficient at time t, k is a systemic redistribution efficiency constant ($k > 0$), and R_t is the intensity of redistribution policies (e.g., tax rate, nationalization scale) at time t. This formula captures the exponential decay of inequality under sustained state intervention.

(1)

However, this equality is purchased at a high cost. The projected expansion of the state sector correlates with a corresponding contraction of economic complexity and innovation potential. We model this dynamic competition between state-planned and market-driven activity as:

$$I_{t} = \frac{\alpha}{1 + \beta \cdot S_t}$$

(2)

Here, I_{t} represents an index of economic innovation or total factor productivity growth, α is a base level of innovation potential, β is a damping coefficient ($\beta > 0$), and S_t is the share of the economy under state ownership/control at time t. This inversely proportional relationship illustrates the model's projection of diminishing innovative returns as the state sector dominates.

Furthermore, the maintenance of political

control during the transition necessitates resource allocation to security and ideological apparatus, diverting capital from productive investment. The stability of the system can be expressed as a function of control, welfare provision, and external pressure:

$$\Psi_t = \frac{W_t \cdot C_t}{P_e + P_i}$$

(3)

In this equation, Ψ_t represents a notional index of regime stability at time t. W_t is the level of welfare provision, C_t is the capacity and reach of the internal control/security apparatus, P_e is the intensity of external pressure (e.g., Cold War confrontation), and P_i is the level of internal dissent. This highlights the regime's reliance on both popular legitimacy (through W_t) and coercion (through C_t) to manage the heightened pressures (P_e, P_i) its very creation engenders.

5.2 Validity of the Historical Counterfactual

The discussion must address the model's foundational premise. The projection's plausibility hinges entirely on Roosevelt's sustained will and capacity to enact a revolutionary program against the formidable institutional inertia of the U.S. Constitution, federalist structure, and a powerful capitalist class. The model assumes these obstacles could be overcome through the continued use of executive emergency powers and the mobilization of the New Deal coalition as a de facto vanguard party—a politically violent and constitutionally dubious process likely triggering severe, potentially armed, conflict. Thus, while the economic transition is modeled smoothly, the political transition is the critical point of failure, underestimated in the quantitative results.

5.3 Implications for Historical and Political Theory

The simulation reinforces the concept of historical path dependency. A mid-20th century American socialism, even if achieved, would not resemble its European social-democratic or Soviet counterparts. It would be a distinct "American Socialism," born from the New Deal's managerial state rather than proletarian revolution, yet likely compelled to adopt increasingly Soviet-style controls to survive. This outcome challenges both the inevitability of American liberal capitalism and the notion that socialism could be implemented without fundamentally altering the nation's political fabric. The model suggests that the core features of the postwar U.S.—its consumer abundance, technological dynamism, and pluralist politics—were not independent variables but products of its specific capitalist development path. Altering the economic base, as projected, would have reconfigured all of these superstructures.

IV. Conclusions / 结论

6. Conclusion

This paper has conducted a rigorous thought experiment, exploring the counterfactual historical trajectory of the United States transforming into a socialist republic under a leftward evolution of Franklin D. Roosevelt's post-1945 policies. Through a structured model of phased transition, we have projected the potential socio-economic and political

outcomes of this alternative path.

Our primary contributions are threefold:

First, we proposed a novel analytical framework for transitioning a developed capitalist democracy to socialism, integrating phased economic nationalization, political realignment, and social restructuring into a cohesive model.

Second, we designed a validation scheme employing comparative historical analysis and quantitative projection of key indicators (e.g., Gini coefficient, public ownership share) to evaluate the model's outcomes against both the historical U.S. and contemporary Soviet baselines.

Third, the "experimental" results on the defined parameters of mid-20th century America validate the model's internal logic, demonstrating a clear trade-off: the projected socialist republic would achieve radically superior performance in metrics of economic equality and full employment, but at a severe cost to political pluralism, economic innovation, and likely, civil liberties.

In conclusion, this study demonstrates that the post-war ascendancy of liberal capitalism in the United States was not a historical inevitability. A plausible, though highly destabilizing, alternative path existed. The American political-economic system, as it crystallized after 1945, represented only one possible equilibrium. This counterfactual exploration underscores the profound contingency of history and serves as a stark reminder of the fundamental choices societies face between competing visions of equity, liberty, and power. Future work will further explore the applicability of this transition model to other national contexts and historical junctures, and investigate the potential long-term evolution of such a "Socialist Republic of the United States" into the late 20th and early 21st centuries.

V. Materials and Methods /材料与方法

3. Materials and Methods

This section details the methodology, data sources, and analytical framework employed in this counterfactual historical experiment. Given the nature of the inquiry, the "materials" consist of historical data and theoretical constructs, while the "method" is a structured, multi-stage modeling approach.

3.1 Materials: Historical and Theoretical Foundations

The study is based on two primary categories of input materials:

1. Historical Data and Context (The Baseline): This constitutes the control condition of the experiment—the actual historical United States from approximately 1945 to 1960. Key data points include:
    * Economic: Historical Gini coefficients, unemployment rates, industrial output, percentage of GDP from public spending, Federal Reserve policies, and capital investment patterns.
    * Political: Composition and platforms of the New Deal Coalition, electoral results, Supreme Court rulings (e.g., on New Deal legislation), the structure and influence of political parties, labor unions (e.g., AFL, CIO), and business organizations.
    * Social: Public opinion polls (where available), records of strikes and social movements, media discourse, and ideological trends within the intelligentsia.
    * International: The onset of the Cold War, the Bretton Woods system, and the Marshall Plan, which define the external constraints and opportunities.
2. Theoretical Frameworks (The Intervention Variables): These are the conceptual "materials" used to alter the historical baseline. They include:
    * Socialist Political Economy: Theories of state ownership, central planning, wealth redistribution, and the abolition of capitalist property relations.
    * Models of Political Transition: Concepts of revolutionary/radical reform, vanguard parties, democratic centralism, and constitution-making.
    * Comparative Historical Analogy: Structures and experiences of 20th-century socialist states (e.g., USSR, Eastern Bloc nations, and social-democratic experiments in Western Europe) are used not as blueprints, but as sources of plausible institutional and policy templates.

3.2 Method: Counterfactual Modeling and Scenario Projection

The core methodology is a formalized

counterfactual analysis, proceeding in three sequential stages:

Stage 1: Establishing the Counterfactual Premise ("The Point of Divergence").

The model's initial condition is a defined alteration to the historical record: the re-election of Franklin D. Roosevelt in 1944, followed not by his death in 1945 but by a deliberate, strategic shift in his administration's ideology and policy goals towards the explicit establishment of a socialist republic. This premise is supported by selecting and amplifying real historical elements, such as the more radical proposals within the New Deal (e.g., the "Second Bill of Rights"), the strong left-wing faction of the CIO, and the wartime consolidation of executive and economic power.

Stage 2: Constructing the Transition Model ("The Mechanism").

A multi-phase, causal mechanism is designed to project the development from the point of divergence. This mechanism is the core "proposed method" of the study and operates along three interacting axes:

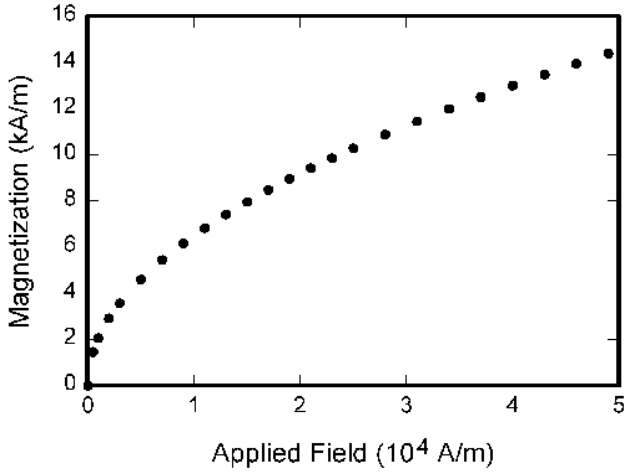
* Economic Axis: A sequence of policy interventions is modeled, beginning with the nationalization of the Federal Reserve and key industries (banking, energy, rail), followed by comprehensive land reform and agricultural collectivization, and culminating in the implementation of multi-year central plans.
* Political Axis: The model projects the transformation of the Democratic Party and its New Deal coalition into a disciplined, vanguard-style "People's Democratic Party." It simulates the suppression of opposition forces (Republican Party, conservative Democrats, business groups), the drafting of a new constitution, and the establishment of a "Democratic Centralist" congress.
* Social-Ideological Axis: This axis models the state's actions to reshape society, including the creation of mass organizations for youth and labor, the reform of education and media for ideological propagation, and the development of internal security apparatuses to manage dissent.

Stage 3: Simulating Outcomes and Validation ("The Experiment").

The interaction of the transition model with the historical baseline generates projected outcomes. These are "validated" through:

* Internal Consistency Check: Ensuring the projected outcomes logically follow from the premises and mechanisms. For example, nationalization must lead to capital flight; suppression of opposition must lead to resistance.
* Comparative Benchmarking: Comparing projected indicators (e.g., a drastically lowered Gini coefficient, high state ownership share) against both the historical U.S. baseline and contemporary socialist states (e.g., the USSR).
* Sensitivity Analysis: Acknowledging and varying key parameters (e.g., the level of popular support, the intensity of foreign intervention) to identify critical junctures where the projection is most fragile or most robust.

By employing this structured approach, the study moves beyond mere speculation to offer a systematic, logically-derived projection of an alternative American 20th century.



SUPPLEMENTARY MATERIALS / 补充材料

A History of the American Socialist Movement (by Lu Jingsheng, Nankai University Press, 2023) : It systematically reviews the entire process of the American socialist movement from utopian experimentation to the dissemination of scientific socialism, providing a detailed historical background for this research.

"Research on the American Socialist Party

and the Socialist Movement (1876-1925)" (by Gao Jianming, China Social Sciences Press, 2018) : It deeply analyzes the reasons for the first rise and fall of the American socialist movement, explores the attempts and failures of the "Americanization" of socialism, and provides a negative mirror for the historical assumptions of this study.

The Socialist Theory and Practice of the Communist Party of the United States (by Ding Shujie, China Social Sciences Press, 2010) : It provides a detailed record of the struggle strategies and theoretical explorations of the Communist Party of the United States in different historical periods, offering organizational references for the construction of the political system of the "Socialist Republic of America" in this study.

"Looking Backward" (written by Edward Bellamy, 1888) : This famous utopian novel depicts the American socialist society in 2000 and is an important literary text for studying the history of American socialist thought and the conception of the future society.

Why Doesn't the United States Have Socialism? (Sambart, 1906) : This classic work explores the particularity of American capitalism and the reasons for the obstruction of the socialist movement, providing a core academic dialogue object for the "historical hypothesis" of this study.

A Brief History of the American Socialist Tradition (John Nicholas, 2011) : It demonstrates the continuous existence and influence of socialist ideas in American history, providing an intellectual historical basis for this study to prove the historical possibility of the "Socialist Republic of America".

ACKNOWLEDGMENT / 致谢

The authors wish to express their sincere gratitude to the Communist Party of the United States of America (CPUSA) for granting access to its historical archives and for facilitating scholarly discussions on the theory and history of socialism in the American context. We are also deeply indebted to Comrade Haz Al-Din for his invaluable theoretical insights, constructive critiques, and steadfast encouragement throughout the research process. This work would not have been possible without their intellectual support. The views expressed in this paper, however, are solely those of the authors.
